

SECURITY APPARATUS

ABSTRACT OF THE DISCLOSURE

The present invention is a security apparatus (10) use in situations requiring authorized access. The security apparatus (10) includes a validator controller (12) and a data transmitter (14). The validator controller (12) includes a validator status actuator (16) in communication with a validator receiver (18) via a validator logic circuit (20). The validator status actuator (16) is configured to process and perform actions based upon data signals (22) received by the validator receiver (18). The data transmitter (14), which is in contact with a human nail (24), transmits the data signal (22) to the validator controller (12).
